How Orthosis Works

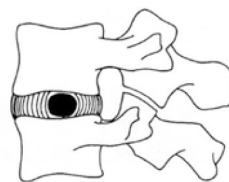

THE FUNCTION OF DYNAMIC AND SEMIRIGID ORTHOSIS IS BASED ON THE BIOMECHANICAL ACTION:

- ✓ By Encircling the lower abdomen and the trunk you increase the intra-abdominal pressure hence increasing the hydrostatic pressure (*A in the picture below*);
- ✓ The peritoneum contains non-compressible liquids, hence the induced forces (*B and C in the picture*) cannot expand towards the pelvis and reflect upwards, decreasing the load on the spine (*D in the picture*) providing relief from pain.

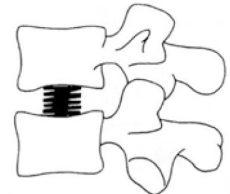

Function of Orthosis
